Resolution

Resolution refers to the number of pixels in a horizontal row and vertical column of an image. The higher the resolution, the more information can be rendered and thus the better image quality. A megapixel network camera features a resolution at least three times larger than that of an analog CCTV camera (traditionally 0.3 megapixel). It is mainly used in video surveillance in wide open areas or scenarios where accurate identification is needed, such as license plate recognition or face recognition.

Smart IR

When the Smart IR function is enabled, the camera automatically adjusts the IR lighting intensity in order to avoid overexposure in night mode and is highly beneficial in capturing usable video when the object of interest is close to the camera and IR LEDs.

Smart IR on

Smart IR off

Digital PTZ

By simulating the PTZ operations, Digital PTZ allows users to move up / down / left / right after zoom-in on the monitoring view for more detail checking.

ONVIF compliant

All Roline products support ONVIF. No compliant issues with other ONVIF products.

Removable IR-cut filter for Day & Night function

When detecting low light environment, the IRcut filter will work automatically switching from day mode to night mode to provide clear view.

Motion Detection

Cameras provide the motion detection feature to lower storage requirements by only recording when motion is present.

Rotate Mode

In a vertical-shaped scene such as hallway or corridor, a horizontal shaped image could result in pixel wasting but with rotate mode cameras can maximize the whole pixel usage.

Horizontal Mode

HD-TVI is Full HD 1080P via coax cable up to 500 m distance

The new HD-TVI Standard supports analog transmission of HD video recording at a resolution of 1080p over distances of up to 500m via coaxial cable or 200m when using a twisted pair cable. HD-TVI uses a low-frequency signal that is largely insensitive to electromagnetic interference, so that the transmission is very reliable. Since the data is not compressed, a real-time display in megapixel resolution is possible without latency. The HD-TVI technology is ideal for upgrading analog systems to HD, because existing facilities are simply taken over and thus investments can be protected in existing infrastructures.

PAL - 720 x 576

720p HD - 1280 x 720

1080p HD - 1920 x 1080

Plug & Play via coax cable

The adjustment of the OSD menu has never been so easy! Thanks to UTC technology all video and data signals can be transmitted via the coaxial cable, means no additional cables (RS485) are required – and via plug & play, everything can connect automatically. The result is exceptional flexibility and easy installation compared to conventional analogue systems: Users can now use existing facilities for the transmission of pictures in HD quality without making large investments.

High compatibility with tribrid-technology

The tribrid-technology of the new HD-TVI series offers seamless compatibility - a real revolution in the field of professional security monitoring. The HD-TVI DVRs can process video signals from analog, HD TVI-, CIF and WD cameras and allow easy integration of different technologies. Thanks to auto-sensing everything goes automatically and the installation is a breeze. Users can now enjoy and take advantage of 1080p resolution without replacing existing equipment and infrastructure. This makes HD DVRs TVI your first choice for retrofitting existing systems.
